I wish that you both have enjoyed your Holidays.

The air emissions research will be very limited. The RFI may shed some more light into it; however, to truly determine the PFOA impact via air emissions SGPP would need to perform air modeling to reconstruct historical PFOA emissions and the footprint of air deposition. At some point we or the State would need to request such modeling.

Excellent points. There is also a closed facility across the river that may be owned by st Gobaine.

In the 2nd to the last bullet below, the SGPP lawyer said that the private well with 194 ppt PFOA (the highest concentration found in a private well so far) is across the river and so surely wasn't contaminated by releases from the McCaffrey Street plant. What about the Saint Gobain facility located on Liberty Street, which is across the river, to be the source of this contamination? Also, if air emissions is one of the transport pathways, then "across the narrow river" does not mean much!!! Needless to mention other possibilities.

Thanks paul. Oak Mitsui or another oak named company used to operate on the west side of the hoosick River , opposite mc Caffrey street. The company is a predecessor to st Gobain , was once owned by Honeywell and is now may be part of the st Gobain holdings.
